

Liberation Musicology

Eben Moglen*

February 19, 2001

The recording industry has been celebrating the supposed defeat of Napster this past week. The Ninth Circuit Court of Appeals has affirmed the grant of a preliminary injunction which may well have the effect of closing the service down completely and ending the commercial existence of Napster's parent. But despite appearances, what has happened, far from being a victory, is the beginning of the industry's end. Even for those who have no particular stake in the sharing of music on the web, there's value in understanding why the Napster "victory" is actually a profound and irreversible calamity. What is now happening to music will soon be happening to many other forms of "content" in our new information society. Seeing Napster free of the smokescreen of industry hype has much to teach us about the collapse of publishers generally, and about the liberative possibilities created by the decay of the cultural oligopolies that dominated the second half of the twentieth century.

The shuttering of Napster will not achieve the music industry's goals because the technology of music-sharing no longer requires the centralized registry of music offered for sharing among the network's listeners that Napster provided. Freely-available software called OpenNap allows any computer in the world to perform the task of facilitating sharing; it is already widely used and the publicity surrounding the Napster lawsuit will only advertise it further. Napster itself—as it kept pointing out to increasingly unsympathetic courts—maintained no inventory of music: it simply allowed listeners to find out what other listeners were offering to share. Almost all the various sharing programs in existence can switch from official Napster to other sharing facilitators with a single click. And when they move, the music moves with them. Now, in the publicity barrage surround-

*Eben Moglen is professor of law and legal history at Columbia University Law School. He serves without fee as General Counsel of the Free Software Foundation. You can read more of his writing at <http://moglen.law.columbia.edu>.

ing the decision, sixty million Napster users will find out about OpenNap, which cannot be sued or prohibited. Suddenly, instead of a problem posed by one commercial entity that can be closed down or acquired, the industry will be facing the same technical threat, but there will be no one to sue but their own customers. No business can survive by suing or harassing its own market. No matter how the industry plays the next round, it is dead.

The music industry (by which we mean the five companies that supply roughly 90% of the world's recorded music) is dying not because of Napster, but because of an underlying economic truth. In the world of digital products that can be copied and moved at no cost, traditional distribution structures, which depend on the ownership of the content or of the right to distribute, are fatally inefficient. As John Guare's famous play has drummed into all our minds, everyone in society is divided from everyone else by at most six degrees of separation. Let's not concentrate on the precise number, but on the fact it reveals: the most efficient distribution system in the world is to let everyone give music to whomever they know who would like it. When music has passed through six hands under the current distribution system, it hasn't even reached the store. When it has passed through six hands in a system that doesn't require the distributor to buy the right to pass it along, after six exchanges it has reached several million listeners.

This increase in efficiency means that composers, song-writers and performers have everything to gain from making use of the system of un-owned or anarchistic distribution, provided that each listener at the end of the chain still knows how to pay the artist, and feels under some obligation to do so, or will buy something else—a concert ticket, a T-shirt, a poster—as a result of the music received for free. Hundreds of potential “business models” remain to be explored once the proprietary distributor has disappeared, no one of which will be perfect for all artistic producers, but all of which will be the subject of experiment in decades to come, once the dinosaurs are gone.

Musicians, though terrified of the possible losses (which the industry is doing everything to overestimate for them) are beginning to discover the enormous potential benefits. No doubt there will be some immediate pain that will be felt by artists rather than the shareholders of music conglomerates. The greatest of celebrity musicians will naturally do fine under any system, while those who are presently waiting tables or driving a cab to support themselves have nothing to lose. For the signed recording artists just barely making it at present, on the other hand, the changes now occurring are of legitimate concern. But musicians as a whole, from the top

to the bottom of the current hierarchy of success, stand to gain far more than they can lose. Their wholesale defection from the existing distribution system is about to begin, leaving the music industry—like manuscript illuminators, piano-roll manufacturers, and letterpress printers—a quaint and diminutive relic of a passé economy.

The industry's giants won't, indeed, disappear overnight, or perhaps at all. But because their role as owner-distributors makes no economic sense, they will have to repackage themselves as suppliers of services in the production and promotion of music. Advertising agencies, production services consultants, packagers—they will be anything but owners of the music they market to the world.

What is most important about this phenomenon is that it applies to much beyond music: to everything in fact that can be distributed frictionlessly as a stream of digital bits that appeal to human taste rather than to functional design. Fiction, poetry, dramatic video, journalism, self-study educational curriculum—all are examples of content that can best (and soon will be) distributed by the simple human mechanism of passing it along.

The result will be a transformation of the world's cultural landscape, as the inefficiencies and frictions, not to mention the crimes, perpetrated by the commercial distributors of culture vanish forever. All the human arts that can be digitally represented are about to experience a profound liberation, as the businesses that made money by excluding some from access in order to raise the price to others disappear completely. The result will be more music, poetry, photography, journalism available to a far wider audience. Artists will see a whole new world of readers, listeners and viewers; though each audience member will be paying less, the artist won't have to take the small end of a split determined by the distribution oligarchs who have cheated, swindled, and robbed them ever since Edison. For those who worry about the cultural, economic and political power of the global media companies, the dreamed-of revolution is at hand. The industry may this week be making a joyful noise unto the Lord, but it is we, not they, who are about to enter the promised land.
